CP-F slim type circuit protectors

250V AC/65V DC (1-pole)	0.1A to 30A
250V AC/125V DC (2-pole)	0.1A to 30A
250V AC (3-pole)	0.1A to 30A

■ Description

FUJI's compact and high-performance CP-F series circuit protectors incorporate FUJI's advanced technology. Their thin sizes make them ideal for use as AC/DC line switches in office and industrial equipment.

■ Features

- Only 17.5mm wide — mounting space is reduced by 30% compared with conventional types.
- AC/DC common use
- Available with auxiliary switch and alarm switch
- Also available in types having inertia delay characteristics
- Trip-free mechanism
- IEC rail mounting

■ Standards

UL (File No.E96846)
TÜV (IEC)(R9650230)
CCC (China GB)(2003010309067080)

■ Accessories

• Auxiliary switch (Type W)

This switch is used for ON-OFF lamp indicator or control circuit.

• Alarm switch (Type K)

This switch can be connected to a warning lamp or buzzer to indicate when the circuit protector has been tripped. Auxiliary and alarm switches for low level circuit are also available on request. (Type W1, K1)

Ratings of auxiliary and alarm switches

Standard type (Type W, K)

250V AC	Resistive load: 1A Inductive load: 0.5A
125V AC	Resistive load: 3A Inductive load: 1A
60V DC	Resistive load: 1A Inductive load: 0.5A
30V DC	Resistive load: 2A Inductive load: 1A

Minimum permissible load

For low level circuit (Type W1, K1)

24V DC	1mA
12V DC	2mA
6V DC	5mA

● Inertia delay device (Type D)

This inertia delay device is designed to prevent the circuit protector from operating erroneously due to such inrush current and to carry out an interruption within the prescribed operating characteristics in the face of an overcurrent.

The protector does not operate even when a pulse current of approx. 14 times (peak value) rated current with a pulse width of 10ms flows.

250V AC 0.3A to 30A
50V DC 0.3A to 30A

■ Description

The CP31 and CP32 have a similar functions to a molded case circuit breaker and they can be used for normal switching ON and OFF operations while breaking both overload and short-circuit currents. They are available in two time-current versions—an instantaneous and a time-delay version. A suitable type should be selected to match the thermal and permissible current requirements. These are recommended for sequential control circuits, motor control circuits, solenoid-operated valves, heaters and solid-state applications.

■ Features

- Excellent arc interruption
Since the arc extinguisher uses a loop blow-out system the arc is rapidly extinguished.
- Highly visible handle indication ON shows red and OFF or TRIP blue.
- When positioned at ON the operating handle is completely housed inside the molded case and does not protrude.
This helps to prevent erroneous operation.
- Trip-free mechanism
- Also available with auxiliary switch SPDT.
- Two time-current versions—
instantaneous operation and a time delay type. Select the model best suited to your protection needs.
- CP31D and CP32D types are of front and rail dual mounting.

■ Time-delay tripping type

30	CP31/30	CP31/30X	CP31D/30	CP32D/30

■ Typical applications

These CP31 and CP32 protectors are used for normal on-off switching of the power supply while also providing overload protection of the load circuits.

Time-delay tripping type

- Control circuits
- Solenoid valves and motor circuits
- Heater circuits

Instantaneous tripping type

- Semiconductor circuits
- SCR (Silicon controlled rectifier) and triac circuits
- Computer peripheral equipment

Circuit Protectors
CP31, CP31D, CP32D

■ Operation

The operation of the magnetic overload release of the CP31, CP31D and CP32D circuit protectors are as shown in the sectional diagram Fig. 1. The magnetic tripping element of the circuit protector is simple—a solenoid coil wound around a hermetically-sealed non-magnetic cylinder containing a spring-loaded movable iron core and a silicon fluid.

When currents less than the rated value flow no movement occurs in either the armature or iron core. However, when a sustained overcurrent occurs the magnetic field is increased. This causes the iron core to move along the cylinder. Once the core reaches the opposite end of the cylinder the armature is attracted which causes the protector to trip as shown in Fig. 2 and 3.

When a short circuit occurs the magnetic flux produced in the coil alone is strong enough to attract the armature regardless of core position. This causes circuit to be interrupted instantaneously. (Fig. 4)

CP-P circuit protectors

250V AC 0.3A to 25A
65V DC 0.3A to 25A

■ Description

CP-P circuit protectors are ideal for electronic circuit protection. The space required per pole is approximately 30% less than that for CP-E models allowing significant space savings. Application at any one of 12 rated currents in the range 0.3A to 25A is possible. CP-P circuit protectors have been approved by  and TÜV Standards.

■ Features

- The mounting space is approximately 30% less than that required with CP-E models, and the width per pole has been reduced by approximately 15%.
- Conforms to IEC Standards. (Conforms to CE markings.)
-  and TÜV approved.
- Operated with an easy-to-use toggle handle.
- Male tab soldering, and right angle terminals are available.

■ Standards

CP-E and CP-V circuit protectors

250V AC 0.05A to 30A
 65V DC 0.05A to 30A

■ Description

CP-E, CP-V circuit protectors have been specially developed for computers, communication equipment and peripheral applications. In these situations power irregularities can lead to serious and expensive damage, and reliable protective equipment is required. FUJI circuit protectors meet this need. These protectors are available with ratings from 50mA to 30A. They are widely used in FA, office machinery, communication equipment and industrial computer-controlled equipment. They are also suitable for extremely severe service since they can withstand mechanical shocks up to 981m/s².

■ Features

- Available in instantaneous, short time, medium time and long time delay types, thus making them suitable for a wide range of electronic applications.
- Also available in types having inertia delay characteristics. These do not trip due to inrush current.
- For internal circuits, series trip, shunt trip, relay trip and switch types are available.
- Circuit protectors with an auxiliary and alarm switch are also available.
- Single pole to 3-pole CP types can be operated with a single handle. Handle holes are easily made in panels.
- Widths down to 19mm.

■ Standards

UL: CP-E, CP-V (File No. E96846),
 (File No. E83461 for switch type), Socket
 CP-S (E96846SP, E83461, LR67978
 (CSA C22.2 No.14))
 TÜV (IEC): CP-V(R50064785)

■ Accessories

• Auxiliary switch (Type W)

This switch is used for indicator lamp or control circuit.

• Alarm switch (Type K)

This switch can be connected to a warning lamp or buzzer to indicate when the circuit protector has been tripped.

Auxiliary (W1) and alarm (K1) switch for low level circuit are also available on request.

■ Specifications

Type	CP31E, V	CP32E, V	CP33E, V	CP34E, V
Pole	1-pole	2-pole	3-pole	4-pole
Rated insulation voltage (Ui)	250V AC 50/60Hz, 65V DC			
Rated operational voltage (Ue)	250V AC 50/60Hz, 60V DC			
Rated current	0.05, 0.1, 0.25, 0.5, 0.75, 1, 2, 2.5, 3, 5, 7.5, 10, 15, 20, 25, 30A			
Rated breaking capacity	1000A at 250V AC 1000A at 60V DC			
Operating characteristic	Long time delay, Medium time delay Short time delay, Instantaneous tripping			
Tripping mechanism	Hydraulic-magnetic			
Ambient temperature	-10°C to +60°C			
Electrical durability	10000 operations

	Auxiliary circuit	Tab, printed board		
Accessories	Auxiliary switch (W, W1)	Available		
	Alarm switch (K, K1)	Available		
	Inertia delay device (D)	Available		
Mass (Approx.)	60g	120g	180g	240g

Ratings of auxiliary and alarm switches

250V AC	Resistive load: 3A Inductive load: 2A
125V AC	Resistive load: 5A Inductive load: 3A
60V DC	Resistive load: 1A Inductive load: 0.5A
30V DC	Resistive load: 4A Inductive load: 3A

• Inertia delay device (Type D)

When a circuit carrying loads such as transformers or lamps is closed, an extremely large inrush current flows. This inertia delay device is designed to prevent the circuit protector from operating erroneously due to such inrush current and to carry out an interruption within the prescribed operating characteristics in the face of an overcurrent.

For instance, the following graph explains that the protector does not operate even when a pulse current of approx. 18 times (peak value) rated current with a pulse width of 8ms flows.

Inertia delay characteristics

- Scale factor of the rated current (%)

$$\frac{\text{Peak value of pulse current}}{\text{Rated current for protector}} \times 100$$

- Waveform of pulse current:
Sinusoidal wave or parabolic pulse

■ Description

FUJI low voltage current-limiting fuses are designed to give protection to power supply and distribution circuits and equipment such as motor starter and semiconductors. Since they can be supplied in a variety of types and ratings any circuit capacities can be accurately matched. FUJI current-limiting fuses have a high interrupting capacity and will prevent thermal and mechanical damage from heavy short circuits.

AF97-635,634

AFaC and BaC type current-limiting fuses

These fuses have a high interrupting capacity of 100kA at 600V AC or DC and are suitable for power and control circuits. The fuse is a plug-in type, and it can easily be replaced by removing a screw cap.

■ **Rated current:** 3 – 400 Amps
For further information see page 08/26.

AF97-642

FCF and FCK type current-limiting fuses

These fuses are provided with special links with low-temperature melting characteristics, and are suitable for general power circuits because of their high interrupting capacity and good current-limiting performance. They are available in two types, a center-blade type and a solid ferrule type, with an insulated fuse body of high quality porcelain.

■ **Rated current:** 1 – 600 Amps
For further information see page 08/29.

AF97-635,634

BLC, CR and CS type Super Rapid Fuses

These fuses are used exclusively for the protection of semiconductors, thyristors and silicon diodes. Since their total clearing I²t is very small protective coordination with semi-conductors is very easily carried out.

■ **Rated current:**
BLC type: 12 – 140 Amps
CR type: 30 – 600 Amps
CS type: 40 – 4700 Amps
For further information see page 08/31.

■ Quick selection table

(CS fuse: Typical value)

Series	Voltage	Interrupting capacity rms sym (kA)					Application
		20	35	50	100	200	
AFaC	600V AC DC	3 to 100 Amps					General use
BaC		125 to 200 Amps					
		250 to 400 Amps					
FCF	500V AC	1 to 60 Amps					General use
FCK	500V AC	3 to 600 Amps

CS15F	1500V AC	450 to 1250 Amps					

Low Voltage Fuses

AFaC and BaC types

AFaC and BaC type current-limiting fuses

600V AC/DC, 3–400 Amps

■ Description

The AFaC and BaC type have an excellent current-limiting performance with an interrupting capacity as high as 100kA at 600V AC/DC. They are suitable for power circuits and control circuit applications including general power cubicles, distribution equipment, motor starters, load centers and control centers. The fuse assembly comprises base, screw cap, fuse link and adapter ring. The universal surface mounting terminals are provided with screws while the rear connection type are supplied with stud bolts. The fuse link can easily and safely be replaced by simply removing a screw cap.

The diameter of the solid ferrule fuse link varies according to the rated current. The higher the rating, the greater the diameter.

As a safety feature the screw cap can only be tightened when the fuse link matches with the adapter ring located inside the base. This prevents the cap from being tightened even when fuse

Rear connection type

Thickness of mounting plate: 3.2mm or less

Surface connection type

link with larger ratings is inserted. The operating blown indication tip can be observed through the screw cap window. The tip color indicates the current rating – for instance, pink indicates 3A and red 10A. The tip is ejected to show that the fuse has blown. Both the base and the screw cap are made from a high class

porcelain insulating material to ensure trouble-free operation. The fuse can be replaced without isolating the circuit. Since the fuse link is housed in a highly reliable porcelain barrel it is strong mechanically and thermally with no danger of explosion or production of noxious gases when blown.

Screw cap

■ Mounting on steel panel

To mount a rear connection base Ba on a steel panel, an insulating plate and some bushings are used. Kits for 30, 60, 100, 200 and 400A base are available. Please specify your base type when ordering.

Two front bushings are used with 100, 200 and 400A base only.

Example: Insulating plate and bushings for Ba30

■ Tightening tool

It is recommended that fuses with ratings of over 100A be tightened with a special tool since there is the possibility of overheating if the screw cap is not adequately tightened. This exclusive use tool is sold separately.

FCF, FCK type current-limiting fuses

500V AC

FCF Up to 60 Amps

FCK Up to 600 Amps

Description

FCF and FCK HRC fuses use a specially designed low-temperature melting element, a feature of 'dual element' fuses. There is no fuse deterioration due to overcurrent phenomena such as rush current at the time of motor starting and they also feature time-lag operation characteristics. They operate rapidly and positively in the face of destructive short circuit currents. Since they are current-limiting fuses with a high capacity of 50kA (FCF types: 1 – 60 Amps) they are suitable for many types of power and control circuits. The fuse link is housed in a ceramic barrel with

excellent thermal and mechanical characteristics and is packed in silica sand which prevents arcing. Thus there are no fears of explosion or production of noxious gases. The FCF's link end is a solid ferrule-type and available in 1 – 60 Amps ratings. The FCK is a center blade-type and available in 3 – 600 Amps ratings. The fuse links for the 75 Amps FCK and larger sizes are provided with a blown fuse indicator.

BLC, CR and CS types Super Rapid Fuses

150–1500 Volts AC
10–4700 Amps

■ Description

The FUJI BLC, CR and CS types are extremely reliable fuses which have been specially developed to provide protection for silicon diodes and thyristors and are suitable for inverters using semiconductors or transformers-rectifiers. FUJI Super Rapid Fuses are designed with a very small total I^2t value which gives them a high speed interrupting action in the face of abnormal currents.

In addition the arc voltage generated at the time of interruption has a low value so that faults will not influence related electric machinery and equipment. These fuses can carry out the protection of many types of circuits rating from the semiconductor overcurrents to destructive short-circuiting faults-i.e. when the

semiconductors short or circuits fail the sound elements will be quickly isolated from the fault circuits.

■ Features

- The total clearing I^2t is small and the semiconductor circuit is completely protected.
- Since the peak arc voltage at the time of interruption is low damage to other equipment does not occur.

- High interrupting capacity of 200kA at 1000V AC
- The CS type is provided with a blown fuse indicator. An alarm contact block (1NO or 1NC) can also be attached.

Super Rapid Fuses

■ Operating indication

● Blown fuse indication

FUJI Super Rapid Fuses are available in BLC, CR and CS types. These types have different methods of indicating a blown fuse.

● BLC type

A blown fuse is indicated by the color tip on the ferrule of the fuse being ejected as shown in Fig. 1. This can be seen through the window of the fuse holder.

● CR type

This fuse does not have a blown indicator but if a trigger fuse is connected as shown in Fig. 2 this will provide the alarm for blown fuse.

● CS type

This fuse is provided with a blown fuse indicator. In this case a pin in the contact pad is ejected after the fuse has been blown. If electrical connections for lamps or alarms are required fit the contact block (1NO or 1NC) to the pad as shown in Fig. 3.

■ Alarm contact block ratings

Type	Contact	Rated voltage (V)	AC		DC			
			Inductive $\cos\phi=0.3\sim1$		Resistive load		Inductive load

■ Application and selection guide BLC, CR and CS-type – Super rapid fuse

When selecting fuses for semiconductor rectifier circuit protection the following conditions must be satisfied.

For additional details contact FUJI.

■ Conditions of application

1. The rated interrupting current of the fuse must be greater than the estimated short circuit current of the circuit.

$$\text{Available short circuit current of rectifier circuit} < \text{Rated interrupting current of fuse}$$

2. The let-thru current value of fuse must be less than the allowable 1/2 cycle surge current value.

$$\text{Fuse let-thru current value} \leq \text{Semiconductor} - 1/2 \text{ cycle allowable surge current 10ms (at 50Hz)}$$

3. The total clearing I^2t value which the fuse requires to complete interruption must be less than the allowable I^2t value of semiconductor.

$$\text{Fuse} - \text{total clearing } I^2t \leq \text{Semiconductor} - I^2t$$

4. The rated current of the fuse must be greater than the average forward current of the semiconductor.

$$\text{Fuse} - \text{rated current} > \text{Semiconductor} - \text{average forward current}$$

5. The rated current and voltage of the fuse must be greater than those of the rectifier circuit.

$$\text{Fuse} - \text{rated current and voltage} > \text{Rectifier circuit} - \text{current and voltage}$$

Method of application

Semiconductor rectifier equipment has a variety of rectifier circuits. Taking the 3-phase bridge rectifier circuit as an example – Fig. (a) and (b) as shown in the following.

Although the number of fuses used in the line fuse method (a) is half the number used in the element fuse method (b), the fuses must have a larger current capacity.

Fig. (a)

Line fuse method

In this method the fuses are connected to the AC line side.

Fig. (b)

Element fuse method

In this method the fuses are connected in series to the semiconductor element.

■ Fuse ratings

When selecting fuses various factors such as protection, coordination and load, etc. must be considered. However, in this catalog the main matters such as voltage, current and I^2t only are explained.

● Rated voltage

The rated voltage of the fuse indicates the maximum operational voltage and this also indicates the root-mean-square value of the AC sinusoidal wave voltage. Select fuses having a rated voltage exceeding the voltage obtained by the formula shown in the following table. (Fig. 1)

Do not select current-limiting fuses with rated voltages drastically exceeding the rectifier circuit voltage. It is necessary to consider the arc voltage.

Fig. 1 Rated voltage required by fuses

Wire connection type	Wiring diagram	Rated voltage of Fuse (V_{FN} rms)	
		For line fuse	For element fuse
Single-phase bridge		$V_{FN} \geq a \cdot E_a$	$V_{FN} \geq a \cdot E_a$
3-phase bridge		$V_{FN} \geq a \cdot E_a$	$V_{FN} \geq a \cdot E_a$
3-phase, double star		$V_{FN} \geq a \cdot \sqrt{3} \cdot E_a$	$V_{FN} \geq a \cdot \sqrt{3} \cdot E_a$

Remarks: The 'a' is a coefficient where the regulation of the AC input voltage is taken into account. This is $a=1.1$ in case of voltage regulation $\pm 10\%$.

Fig. 2 Element current and line current

Wire connection type	Wiring diagram	Element fuse method Element current I_a	Line fuse method Line current I_l
Single-phase bridge		$I_a = \frac{I_d}{\sqrt{2}} = 0.707d$	$I_l = d$
3-phase bridge		$I_a = \frac{I_d}{\sqrt{3}} = 0.577dl$	$I_l = \sqrt{\frac{2}{3}} I_d = 0.816dl$
3-phase, double star		$I_l = I_a = \frac{I_d}{2\sqrt{3}} = 0.289dl$	

Low Voltage Fuses

BLC, CR and CS types

Super Rapid Fuses

• Rated current

The current values in fuses in the line fuse system and the element fuse system are different. Obtain the correct current value from the table on page 08/41 (Fig. 2).

When selecting the rated current of a fuse choose a fuse having an amperage rating greater than the current which flows in the semiconductor if the load is continuous and a fixed current.

If the current which flows in the semiconductor is greater than the rated current of the fuse connect the fuses in parallel. However, in this case, if the numbers of fuses arranged in parallel are 'n', then the I^2t value of the fuse will be $n^2 \cdot I^2t$ and n^2 times the I^2t value of one fuse. This should be taken into consideration when protective coordination is taken into account. In the case of the circuit where the load rapidly varies the fuse element will suffer from mechanical deterioration and be damaged by thermal stress. In loads of this type the deterioration characteristics of the fuse must be closely considered.

Moreover if the fuse current – time characteristics of the fuse selected is less than the overload characteristics of the semiconductor element then complete protection can be obtained. However, if the semiconductor element has a large capacity then protective cooperation is very difficult to arrange. The fuses are used to isolate the shorted semiconductor element circuit from sound operating circuits.

■ Total clearing I^2t

The total clearing I^2t of fuse is a very important factor when considering the protective coordination of the semiconductor. This total clearing I^2t is the value where the arcing I^2t is added to the melting I^2t . Therefore it is necessary to satisfy the following formula.

$$\text{Fuse – total clearing } I^2t \geq \text{Semiconductor } I^2t$$

The total clearing I^2t of fuse depends upon the operational voltage and interrupting current.

Therefore, for this reason if a 500 Volts fuse is used in a 300 Volts circuit the total clearing I^2t is reduced by 50–70%. However, the reduction rate varies according to the type of fuse construction. This must be checked and confirmed once more.

Example

I^2t

All I^2t values are ampere² seconds.

The I^2t data for silicon diodes or thyristor elements are normally given in their respective catalogs. If the A²S data is not given in their catalog obtain the value in the following manner. If protection is needed for a 250V, 150A (I_o) diode having a maximum allowable peak half sine wave current of 2700A, it is important that the fuse has a total I^2t value lower than that of the diode.

Calculation

$$\begin{aligned} \text{Maximum } I^2t \text{ diode} &= \left(\frac{1 \text{ Peak}}{2} \right)^2 0.0167 \\ &= \left(\frac{2700}{2} \right)^2 0.0167 \\ &= 30,400 \text{ A}^2 \text{ Sec.} \end{aligned}$$

From the table (Page 08/38), the fuse with a total I^2t nearest to 30,400A² Sec. is the 260 Ampere fuse (CR 2L-260).

■ Interrupting current

The rated interrupting current of the fuse must exceed the maximum value (Symmetrical RMS value) of the estimated circuit fault current.

■ Peak arc voltage

In the case of the current-limiting fuse an arc voltage (overvoltage) is generated at the time of interruption due to its fusible element construction. It is necessary to check that this peak arc voltage does not exceed the semiconductor's maximum (Non-repetitive peak) reverse voltage value.

■ Current limitation

Select a fuse whose let-thru current value does not exceed the allowable 1/2 cycle surge current of the semiconductor. The allowable surge current is the peak value of the current which in case at 50Hz is allowed to flow for 10ms. In the current-limiting fuse the fault must be cleared in the shortest possible time or in the first 1/2 cycle.

Available current is the current which would flow if the fuse were not current-limiting.

This would cause damage to equipment. Let-thru current is the actual current allowed to flow by the current limiting action of the fuse. A number of let-thru current graphs are given in this catalog and example is given in the following paragraph. The method of reading this graph is provided for your reference.

How to find a let-thru current

– Example

Fuse: 200 Amps 500V

Available R.M.S symmetrical current:

100,000 Amps

Let-thru peak current (Instantaneous):

11,600 Amps

Let-thru R.M.S. current

$11,600 \div 1.7 = 6,800$ Amps

This example clearly shows that while a 100kA (rms, sym) current is available, the fuse limits the current let-thru to 6,800 Amperes (rms, sym).

Catalog Disclaimer

The information contained in this catalog does not constitute an express or implied warranty of quality, any warranty of merchantability or fitness for a particular purpose is hereby disclaimed.

Since the user's product information, specific use application, and conditions of use are all outside of Fuji Electric FA Components & Systems' control, **it shall be the responsibility of the user to determine the suitability of any of the products mentioned for the user's application.**

One Year Limited Warranty

The products identified in this catalog shall be sold pursuant to the terms and conditions identified in the "Conditions of Sale" issued by Fuji Electric FA with each order confirmation.

Except to the extent otherwise provided for in the Conditions of Sale issued by Fuji Electric FA, Fuji Electric FA warrants that the Fuji Electric FA products identified in this catalog shall be free from significant defects in materials and workmanship provided the product has not been: 1) repaired or altered by others than Fuji Electric FA; 2) subjected to negligence, accident, misuse, or damage by circumstances beyond Fuji Electric FA's control; 3) improperly operated, maintained or stored; or 4) used in other than normal use or service. This warranty shall apply only to defects appearing within one (1) year from the date of shipment by Fuji Electric FA, and in such case, only if such defects are reported to Fuji Electric FA within thirty (30) days of discovery by purchaser. Such notice should be submitted in writing to Fuji Electric FA at 5-7, Nihonbashi Odemma-cho, Chuo-ku, Tokyo, Japan. The sole and exclusive remedy with respect to the above warranty whether such claim is based on warranty, contract, negligence, strict liability or any other theory, is limited to the repair or replacement of such product or, at Fuji Electric FA's option reimbursement by Fuji Electric FA of the purchase price paid to Fuji Electric FA for the particular product. **Fuji Electric FA does not make any other representations or warranties, whether oral or in writing, expressed or implied, including but not limited to any warranty regarding merchantability or fitness for a particular purpose.** Except as provided in the Conditions of Sale, no agent or representative of Fuji Electric FA is authorized to modify the terms of this warranty in writing or orally.

In no event shall Fuji Electric FA be liable for special, indirect or consequential damages, including but not limited to, loss of use of the product, other equipment, plant and power system which is installed with the product, loss of profits or revenues, cost of capital, or claims against the purchaser or user of the product by its customers resulting from the use of information, recommendations and descriptions contained herein. The purchaser agrees to pass on to its customers and users, in writing at the time inquiries and orders are received by buyer, Fuji Electric FA's warranty as set forth above.

Caution "Safety precautions"

- Operate (keep) in the environment specified in the operating instructions and manual. High temperature, high humidity, condensation, dust, corrosive gases, oil, organic solvents, excessive vibration or shock might cause electric shock, fire, erratic operation or failure.
- Follow the regulations of industrial wastes when the product is to be discarded.
- The products covered in this catalog have not been designed or manufactured for use in equipment or systems which, in the event of failure, can lead to loss of human life.
- If you intend to use the products covered in this catalog for special applications, such as for nuclear energy control, aerospace, medical, or transportation, please consult our Fuji Electric FA agent.
- Be sure to provide protective measures when using the product covered in these catalogs in equipment which, in the event of failure, may lead to loss of human life or other grave results.
- Follow the directions of the operating instructions when mounting the product.
